## ENGLISH CHESS PROBLEMS

EDITED BY<br>James Pierce and W. Timbrell Pierce [1876]<br>"Look what is best; that best I wish in thee."<br>Shakspeare<br>"Keen to track<br>Suggestion to her inmost cell."

White to play and mate in four moves

## DEDICATION

To FRANK HEALEY, Esq.

Dear Sir,
You have, by so many masterpieces of Chess strategy, rendered your name, and thereby English Chess Problem Composition, famous all over the world, that we feel there is a peculiar fitness in availing ourselves of your kind permission to dedicate such a work as this to yourself. Without your support we should certainly not have undertaken thetask, but we havereceived such ampleand cordial help both from you and from others almost equally distinguished, that we feel sure that the work will be of great value, not only to living composers, but also to those who may come after, marking as it unmistakably does the character which the art has assumed at the present time. The most superficial student may see in what striking contrast it stands to the composition of previous periods, and without question this is due mainly to yourself, as the pioneer of new and suggestive ideas, as remarkable for their depth and beauty, as for their neat and elegant construction.

We are, Dear Sir,
Yours faithfully,
THE EDITORS.

## February 1876

The present edition of English Chess Problemsfollows the original edition, published by Longmans, Green \& Co., London, in 1876, as closely as possible as far as contents is concerned. The layout has been modified to place six problems on a page instead of one, in order to reduce the number of pages required, and solutions have been translated into algebraic notation, using 'S' to indicate knights.
The only change to the solutions has been to change over-general statements (e.g. 'Q mates' or 'Anything') to specify the move or the piece in such cases where only one single move or piece was possible.

All problems have been checked with the help of computer programs. Problemiste by M atthieu Leschemelles was used for problems to 6 moves. For longer problems, Fritz 4.01 and Crafty with the Nalimov endgame databases were used for rough checking and exploration of the intended solution.
69 problems were found to be unsound. They have been indicated as follows:
[*] problem has more than one solution.
[ $\dagger$ ] problem has no solution.
[ $\dagger^{*}$ ] author's solution is cooked, but with second solution(s).
[?] problem appears to be misprinted.
[!] problem with possible correction suggested in solution.
[corr.] problem has been corrected from the original edition.
In all cases, further details are given in the solution.

The history of the progress of Chess problems has yet to be written. A work, giving, in a chronological order, the best specimens of successive periods would be highly interesting and instructive. The most compendious treatise of the kind is Alexandre's Collection, consisting of several thousand problems of all ages; but these are not arranged on any plan, and a large percentage of them are wrong. The next English work we know of is that published some fifteen years ago by Mr. J. A. Miles (himself a composer of considerable merit), called "Chess Gems." This collection is not restricted to the works of the English or any particular school, but contains the finest specimens, collected by the author from all times and countries. We think the time has now arrived, considering the rapid advance of Chess knowledge, and in particular the general interest taken in problems, that the results of the last twenty years should again be sifted, and the best preserved in a permanent form. If the idea carried out in the present work be followed up on the Continent and in America, we should have the groundwork or basis for a larger and more refined selection, derived from the masterpieces of the whole world, arranged in a proper historical or chronological form. TheAmerican Chess Nuts is, indeed, a magnificent contribution towards this object. The chief objection to this work is that the student has to skim the cream for himself; the object of the compilers apparently being to embrace as large a number of problems as they could gather together without any especial regard to their quality; and consequently the gems of the collection can be arrived at only after long labour and research. This fault we have endeavoured to avoid. We have, as a general rule, restricted the number of problems by each author to twelve. We have devoted a separate chapter to the works of authors recently deceased, and have thought it wise to include some of the more excellent stratagems of our English Chess Problem Fathers, Bolton and Bone, names which will always be regarded with esteem and admiration. For the selection of Bolton's masterpieces weare greatly indebted to the Rev. Mr. Gape, who very kindly placed all Mr. Bolton'sMSS. at our disposal. As most of these problems represent the old school of composition, this chapter forms an admirable contrast between theremote and more modern styles, as it is immediately succeeded by a chapter of novelties, giving problems by the chief English composers, made especially for this book. It is to this chapter we fancy all Chess lovers will turn with the greatest pleasure and interest. If it had not been for the great kindness of Mr. H.J.C. Andrews, we should have hesitated considerably before resolving to add the labour of examining so many new productions to that of our other
editorial duties. Should this chapter, as we hopeand believe is the fact, be without flaw as regards second solutions, and with only here and there a few unavoidable duals, the sole merit will be due to our esteemed contributor, whose kind and gratuitous labour we have great pleasure in publicly acknowledging.
On comparing ancient and modern problems as a whole (and, of course, excepting well-known and most able ancient productions), we think it will be found that problems at first were little better than ingenious end games. It was considered the highest art to give Black a most preponderating force and White an apparently hopeless position, out of which he is made to extricate himself by a series of sacrifices or successive checks. In general, Black's moves were all forced. With a better knowledge of the game, a more scientific style of composition gradually came into vogue. Instead of the old clumsy mates in so many hundred moves, or under such and such absurd conditions and restrictions, composers endeavoured to concentrate their powers on mates in three, four, and five moves. In these days the resemblance of the position to an end game is no longer considered necessary or desirable; the sole aim of the author now is to render his idea in the simplest and most compact form possible, using no superfluous piece or pawn. With a more subtle range of ideas and stratagems, a greater punctiliousness obtained to avoid dual methods of solution in reply to any particular form of defence; and, while richness or variety of play is always aimed at, a single line of attack in reply to each variation is deemed almost indispensable. To this æsthetic sense of fitness and purity may be attributed the excellency of modern problems over those of earlier date. Some, indeed, carry their sensitiveness to an absurd extent, and would trammel the genius of an author by a set of hard and fast grammatical rules; they would proclaim a problem faulty or imperfect because of some second way of solving it, or "dual," even in a minor variation, utterly oblivious of artistic exigencies or other merits, for the sake of which the duals may be allowed to exist. Of course, in consequence of the vast number of skilful composers now living and periodically contributing to the shoals of weekly Chess-columns appearing all over the world, a far larger number of clever solvers have simultaneously arisen. Many of these now occupy the first rank as analysts, and, although not necessarily composers themselves, from the skill and power of insight they have acquired by long practice in discriminating the merits of a position, they havegradually come to be regarded as the best critics on problems. The older stratagems were never subjected to half the fire of scrutiny and analysis the productions of our day have to undergo, and, consequently, there was nothing like the same accuracy or finish; to this may be added the intense rivalry which now exists, and is stimulated by the constant problem tourneys, international and local, which annually occur. This continual friction
and action of mind upon mind has produced the happiest results. The compositions of our best men are now as remarkable for their extreme elegance and accurate construction as they are for the grace and beauty of their conception. There is, however, we fancy, a danger that the practised solver may be inclined to condemn a problem too readily, to satisfy his insatiable delight in the search after duals. It would be well to lay down some broad general principles to govern composers and examiners as to the admission or exclusion of duals. As yet, however, there exists great diversity of opinion on the subject, although we believe the liberal views lately expressed will ultimately triumph over those of some American purists. A problem is a mixed work of science and art, and these elements are to a certain extent antagonistic. A flaw in the construction, duals in a minor variation, or weak defence, may readily be forgiven when they are necessary to secure the original idea intact, provided always their existence is not due to carelessness but simply from necessity; the necessity being judged chiefly from the artistic, and not only from the constructive point of view. We trust the study of this work, containing, as it undoubtedly does, some of the very finest specimens of modern art, will conduce to develope the growing genius of our future Andrews, Grimshaws, Healeys, \&c., \&c.
A few words, perhaps, are needed to explain why we have adopted the present arrangement of grouping the problems according to the number of moves. Although, by not having all the problems of each author kept together, one great advantage is, to a certain extent, sacrificed, viz., that of studying the special characteristics of each composer's style, yet we felt that such loss was more than compensated by the gain in variety arising out of the contrast of stratagems conceived by different minds. Such contrast is certainly very real and of great interest. For, extraordinary as it may seem, that, with such a limited mechanism at command as there is in Chess, there should be so many distinct conceptions realizable; it is still more wonderful that the productions of each author, and, in a wider sense, those of a nation, should have certain marked characteristics which may be found to vary from time to time in the same way as its art and literature. Hence the value of collections such as this, and it will not be without service, if, as we believe, it fairly reflects the genius of the best English composers, and thus generally of English Chess Problem composition during this century.*

* The Editors wish to note that in consequence of the sudden decease of their contributor, Mr. F. H. Deacon, his set should strictly be placed in Part II., but his death occurred when the work was too far advanced in the press to admit of alteration. They esteem themselves very fortunate in having a problem by Mr. Deacon composed quite recently, and expressly for this book, and this the more, as he had for some years given up problem composing.

## SOME HINTS ON PROBLEM CONSTRUCTION

So much has been written lately on the above subject, and so many different views expressed, that it is difficult to ascertain the current in which the general opinion of composers runs. The few remarks we are about to offer have no authoritative value, but may be of some assistance towards bringing the several points at issue to some final judgment. But whatever rules may be laid down they will always be disregarded, and, to a certain extent, ignored by the leading composers of each country. In Chess, as in all other things, genius will not be bound by any fixed rule. It makes its own rules; and rightly so. In suggesting, therefore, the principles which should govern the attempts of youthful aspirants in the art of problem construction, it is necessary to deduce them from the works of recognised masters, such as Healey of England, Loyd of America, and Bayer of Germany. It would be the height of folly to attempt to dictate to such men; we must be content to learn what they teach, and to ascertain upon what common principles their chief works are constructed. First of all, then, we shall find in the problems of these three masters, and notably in those of Healey and Loyd, that there exists a certain affinity between the idea and its expression. The body or form in which the soul or thought is enshrined is just the one of all possible which is most appropriate, or which expresses it in the happiest and apparently least laboured manner. It is just this faculty or perception of fitness which is peculiar to those highly gifted with the genius of Chess art. Others may have equally fine or subtle ideas, but they are unable to give them their neatest expression; the labour and study is too apparent. The result may indeed be a difficult problem, but the form is artificial and laboured; in fact, they manufacture so ugly a body, that they give no pleasure or sense of beauty to the unhappy solver. The value of a problem may be measured by the pleasure it is capable of giving. "Ars est celare artem;" this is peculiarly true of Chess problems. In the most beautiful stratagems of Loyd, the positions are al ways most natural, and thestudy which they must have cost the composer is never visible, the idea and form being co-related in the fittest manner. Thefollowing principles should thereforeobtain, first, not to give either side a greater force than is required to express fully the idea. Whilst it is good to give Black as great a defensive power as possible (so long as the unity of the idea is not obscured), it is the greatest mistake to aim at giving him a stronger force than White. Some youthful composers think it wise apparently to crush White by giving Black an overwhelming force. It is generally most difficult to solve those problems whereBlack has only his King, for the simple reason that the adversary has then so many possiblemethods of directing
his attack that it is not easy to detect the one way leading to success Disparity of force then between the two sides is not to be regarded as a fault, whether it occur on oneside or the other. The fault to be avoided in all problems is rather superfluity of force. It is not legitimate to insert a piece merely to mislead, but which otherwise has no bearing on the solution. Each piece on either side should be fully wanted, the power which it can exert should be utilised to the greatest extent possible. This principle has been aptly termed "economy of force," and although the idea has been ridiculed lately by an editor of one of our leading Chess magazines, it is one which composers should faithfully observe. In fact, it is only by attending to this one golden rule, viz., the employment of the least force possible, that one can arrive at the fittest construction, and, if the fittest, in consequence, the most difficult concealment of the idea or stratagem. By its due observance, also, almost all the other evils incidental to problem construction will be found to vanish; namely, clumsy crowding together of pieces, unnatural and impossible positions, \&c., \&c.
This principle of "economy of force" is not necessarily inconsistent with the object of giving Black a varied and powerful defence. The defence must bear on the attack threatened, or the force in which the former consists must be reckoned superfluous or wasted. Variations are not to be introduced simply for the sake of rendering the problem more difficult, unless they are to some extent, at least, in harmony with the main idea. The composers who best illustrate the advantage of giving Black a rich and varied defence are Andrews of England, and Bayer of Germany; their problems are distinguished principally for the display of great and brilliant resources against a number of powerful and varied defences. They are like those beautiful sky-rockets, which, after their main strong flight is ended, and all seems over, suddenly scatter beautiful series of clustered stars, each of which afterwards breaks up into numberless and ever varied repetitions. This kind of problem forms quite class of its own, and is, perhaps, the highest development of this branch of Chess strategy. Of course, in reply to so many lines of defence, it is not always possibleto secureone method of solution, and this leads us to the discussion of the much-vexed question of "duals." We have never regarded "duals," or second ways in variations, as the evil of evils to be avoided in problems. Of course, they are to beguarded against, but as we have already stated our views pretty fully, in the Introduction, on this point, it is not necessary to repeat them here. Suffice it to say, that they become less objectionable the more remote the variation in which they occur lies from the main line of play or central idea of the problem. We would next say a few words on "strategy." Although the artifices resorted to are limited, and might easily be tabulated, still this does not constitute the virtue or essence of a problem, any more than the leaves which compose a flower represent the
flower. For, were this the case, not only would problem composition soon cease to be an art, but it would as soon cease to be cared for or practised. The artifice stands in the same relation to the strategy as the verse and metre of a poem stand in relation to the poem. There is a nameless something besides, in the structure or expression of an idea, an exquisite balancing of force against force, a manifestation of skill and tact in concealing the sacrifice, or the reserve of energy concentrated by some apparently aimless coup, which constitute the beauty and strength of a position. But to the beginner we may say a few words here, which may prove of service. First, then, avoid positions in which an idea is evolved by successive checks, as such, whatever the ingenuity, and however numerous the variations, are comparatively easy, and belong to a lower order of composition altogether. Again, composers are at first very fond of making the main idea consist in a series of sacrifices. Now, such problems are not of the highest rank at all, as reference to the problems by the best composers in this volume will amply demonstrate. We may especially citeJ. B. of Bridport and Healey as exemplifyingthis. In our view, the finest conceptions are those where, by some move or set of moves difficult to see, either through their subtlety or the manifold resources in defence, a store of energy is laid up which breaks out at last and ensures defeat. Others may prefer conceptions of a different kind; but in all there must be concealment of design, not through over-crowding, but through what we can only define as naturalness of position and a range of choice of moves as extensive as possible. One word on two move problems. Such have been decried as too easy for any but tyros, and not worth the pains bestowed on their composition. This we consider is a great mistake. Of all problems, a good two mover is probably the most difficult to compose; for here, if anywhere, duals are to be avoided in reply to every move worthy the name of a defence; it is essential here, if anywhere, that the idea should beconcealed, and this can only be done in general by allowing considerable freedom or scope on both sides with plenty of resources on the part of Black. These problems are sui generis, as in a two mover more than any other there is a balance of power, if we may so speak, which, if slightly disturbed by any move but the right one, destroys the harmony contemplated; hence the niceness and delicacy of the artifice; to ensure, amidst the clash of so many forces, a subtle but exact stroke, which suffices, in each case, to effect with some piece a mate next move. Sometimes accordingly the full beauty of a "coup de repos" is brought out; sometimes Black's own strokes here and there are used against himself; sometimes we have, on both sides, checks by discovery, like the quick crossing of swords in a duel.

Problems of three moves are and will probably remain the most popular and pleasing; because there is just enough difficulty about them without the intricacy and depth which belongto others in four or
five moves. At the same time, in the latter, there is a scope for manœuvre and design, serving to render many problems of this class profound studies, containing many beautiful variations.

In conclusion, young composers must learn to depend upon themselves, and upon their own sense of what is right. Excellency in the art will never come by mere drudgery or study of other men's works, unless accompanied by a love for Chess and a special and innate aptitude for it. We shall watch with interest the future development of this most beautiful and fascinating study-for of further development it is without question susceptible-in just the same way as of late years it has taken new forms of a distinct character, and may do so again.
There is no doubt that the study of Chess has much increased, among all classes. Thenumber of Chess periodicals now in circulation, of good works recently published on the subject, and of new clubs constantly being formed all over the country, prove this. It is greatly to be desired that our working classes should learn more and more to share in the pure and intellectual enjoyment of the game, which would thus gradually bethe mean of weaning them from other debasing, if not vicious, pursuits or sources of recreation.

## SOLUTIONS

## SOLUTIONSPARTI

## SECTION 1:TWO MOVE PROBLEMS

The following symbols and conventions have been used in the solutions:

## $\dagger$ check

$\ddagger \quad$ mate
/ separates different destination squares by same piece. Thus ‘Ke3/ d3' indicates the two moves Ke 2 and Kd 3 .
, (in short solutions) separates moves by different pieces. Thus 'Ke2,d3' indicates the moves Ke2 and (P)d3.
~ indicates any of the legal moves by the specified piece.
